1 NP-Hardness

1.1 Halting problem

Let be φ an instance of SAT problem. We denote by n the number of variables.

Let be M a TURING machine which tests in a cycle all the 2^n possible assignments of the previous formula : when M has tested all assignments, it starts again. This machine halts if and only if φ is satisfiable. This reduction is polynomial, therefore $SAT \leq_p HALT$, ie. $HALT$ is NP -hard since SAT is NP -hard.

$HALT$ is not NP -complete otherwise it was decidable by a TURING-machine, but $HALT$ is unsatisfiable.

1.2 TQBF

All instance of SAT problem is an instance of $TQBF$. Without transformation, we have a polynomial reduction, ie. $SAT \leq_p TQBF$ so $TQBF$ is NP -hard.

This problem is known for being PSPACE-complete. It's not NP-complete.

1.3 NAE – 3 – SAT

Let be φ an instance of $NAE - 3 - SAT$.

$$\varphi = \bigwedge_{i=1}^n (x_{i,1} \vee x_{i,2} \vee x_{i,3})$$

We will describe the "not all equal" condition in term of formula.

$$\bigwedge_{i=1}^n \neg(x_{i,1} \wedge x_{i,2} \wedge x_{i,3}) \wedge \neg(\neg x_{i,1} \wedge \neg x_{i,2} \wedge \neg x_{i,3})$$

using DE MORGAN's law:

$$\psi := \bigwedge_{i=1}^n (\neg x_{i,1} \vee \neg x_{i,2} \vee \neg x_{i,3}) \wedge (x_{i,1} \vee x_{i,2} \vee x_{i,3})$$

$$|\psi| \sim 2|\varphi| \Rightarrow |\psi| = \mathcal{O}(|\varphi|).$$

Let $\omega := \varphi \wedge \psi$. ω is an instance of SAT and the reduction is polynomial. If there is a solution to the SAT problem ξ , then φ is satisfied and, thanks to ψ , the "not all equal" condition is true.

Reciprocally, if there is a solution of the $NAE - 3 - SAT$ problem φ , then this assignation makes ζ true. Consequently, $SAT \leq_p NAE - 3 - SAT$ and $NAE - 3 - SAT$ is NP -hard.

Moreover, $NAE - 3 - SAT$ is clearly NP : a valid assignation is a sufficient witness. We can check in polynomial time if this assignation makes the formula true and if the "not all equal" condition is satisfied. Then $NAE - 3 - SAT$ is NP -complete.

2 Reductions

3 Difference of NP problems

Proposition 1. $EXACTINDSET$ is in DP .

Proof. Let A be the set of all pairs (G, k) such that G has an independent set of size at least k , and let B be the set of all pairs (G, k) such that G has an independent set of size at least $k + 1$. Then $EXACTINDSET = A \setminus B$ and A is in NP and B is in NP . Hence by definition of DP , $EXACTINDSET$ is in DP . \square

Proposition 2. $\forall L \in DP, L$ is polynomial-time reducible to $EXACTINDSET$.

Proof.

Lemma 3. $INDSET \geq_p 3 - SAT$

Proof. Suppose we have an instance F of $3 - SAT$ problem where $F = \bigwedge_{i=1}^m C_i$ where C_i is the disjunction of 3 variables. We note x_1, \dots, x_n the variables. We create the graph G as follows:

- For each variable in each clause, create a vertex, which we will label with the name of the variable. Therefore there may be multiple vertices with the label x_i or $\neg x_i$, if these variables appear in multiple clauses.
- For each clause, add an edge between the three vertices corresponding the variables from that clause.
- For all i , add an edge between every pair of vertices with one is labelled with x_i and the other labelled with x_i .

There is a independent set of size m in G if and only if F is satisfiable. \square

We note that this reduction from $3 - SAT$ to $INDSET$ took an instance φ of $3 - SAT$ consisting of m clauses each of three literals and produced a graph G_φ with $3m$ vertices such that if φ is satisfiable then the largest independent set in G has m vertices, and if G is unsatisfiable then the largest independent set of G has at most $m - 1$ vertices.

Now suppose that A is in DP . We want to show that $A \leq_p EXACTINDSET$. By definition of DP , $A = L_1 \setminus L_2$ for $(L_1, L_2) \in NP^2$. Since $3 - SAT$ is NP -complete, there are polytime functions f_1, f_2 such that for $i = 1, 2$ and for all $x \in \{0, 1\}^*$ we have $x \in L_i \Leftrightarrow f_i(x) \in 3SAT$. Hence for each fixed $x \in \{0, 1\}^*$, setting $\varphi_i = f_i(x)$, we have $x \in L_i \Leftrightarrow \varphi_i$ is satisfiable. Thus from the above reduction to $INDSET$, there is a polytime function which takes x to a pair of graphs G_1, G_2 such that if m_i is the number of clauses in φ_i , then for $i = 1, 2$, no independent set in G_i has more than m_i vertices, and $x \in L_i \Leftrightarrow$ the largest independent set in G_i has size m_i .

Now we use the notation $G \sqcup H$ for the disjoint union of graphs G and H . That is, the vertices in $G \sqcup H$ are the disjoint union of those in G and H , and similarly for the edges. Now let $G'_1 = G_1 \sqcup G_1$. Then a maximum independent set in G'_1 is the union of maximum independent sets in the two copies of G_1 .

Thus $x \in L_1 \Rightarrow$ maximum independent set of G'_1 is $2m_1$ and $x \in \overline{L_1} \Rightarrow$ maximum independent set of G'_1 is $\leq 2m_1 - 2$. Now define G'_2 so that its vertices are those of G_2 together with $m_2 - 1$ new vertices, and the edges consist of those of G_2 together with an edge from each of the new vertices to every vertex of G_2 . Then we have designed G'_2 so that no independent set can contain both vertices of G_2 and new vertices, so $x \in L_2 \Rightarrow$ maximum independent set of G'_2 is m_2 , $x \in \overline{L_2} \Rightarrow$ maximum independent set of G'_2 is $m_2 - 1$. Now let $G_3 = G'_1 \sqcup G'_2$ and let $k = 2m_1 + m_2 - 1$. To finish the proof that $A \leq_p DP$, it suffices to show that

Lemma 4.

$$x \in A \Leftrightarrow (G_3, k) \in DP$$

(\Rightarrow): Suppose $x \in A$. Then by (2) $x \in L_1 \cap L_2$, so by (3) and (6) we conclude the maximum independent set of $G_3 = G'_1 \sqcup G'_2$ is $2m_1 + m_2 - 1 = k$.

(\Leftarrow): Suppose $x \notin A$. There are three cases:

- $x \in L_1 \cap L_2 \Rightarrow \text{maxindset}(G_3) = 2m_1 + m_2 > k$.
- $x \in L_1 \cap \overline{L_2} \Rightarrow \text{maxindset}(G_3) \leq 2m_1 + m_2 - 2 < k$
- $x \in \overline{L_1} \cap L_2 \Rightarrow \text{maxindset}(G_3) = 2m_1 + m_2 - 3 < k$

□

Theorem 5. EXACTINDSET is DP-complete.

Proof. EXACTINDSET is in DP (lemma 1) and it is DP-hard (lemma 2).
